

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact [support@jstor.org](mailto:support@jstor.org).

*Of the Judgement of some of the English Astronomers, touching the difference between two learned men, about an Observation made of the First of the two late Comets.*

Whereas notice has been taken in *Num. 6.* of these *Transactions*, that there was some difference between those two deservedly celebrated Philosophers, *Monsieur Hevelius* and *Monsieur Auxout*, concerning an Observation, made by the former of them, on the  $\frac{5}{3}$  of *February 1665.* & that thereupon some Eminent *English* Astronomers, considering the importance of the dispute, had undertaken the examination thereof; it will, 'tis conceived, not be unacceptable to such, as saw those Papers, to be informed, what has been done and discerned by them in that matter. They having therefore compared the Printed Writings of the two Dissenters, and withall consulted the observations made with *Telescopes* at home, by some of the most intelligent Astronomers amongst them, who have attentively observed the Position of that *Comet* to the *Telescopical* stars, that lay in its way; Do thereupon Joyntly conclude, that,

By *Telescopical Stars* are understood such, as are not seen, but by the help of a *Telescope.*

whatever that Appearance was, which was seen near the *First Star* of *Aries*, by *Monsieur Hevelius* (the truth of whose relation concerning the same, they do in no wise question) the said *Comet* did not come neer that *Star* in the left *Ear* of *Aries*, where the said *M. Hevelius* supposes it to have passed, but took its course neer the *Bright Star* in its *Left Horn*, according to *Bayers Tables.* And since that the Observations of judicious both *French, Italian, &c. Dutch* Astronomers (as many of them, as are come to the knowledge of the *English*) do in the main fully agree with theirs, they do not at all doubt, but that, there being such an unanimous

con-

consent in what has been just now declared, & the Controversie being about *Matter of fact*, wherein Authority, Number, and Reputation must cast the Ballance, *Monf. Hevelius*, who is as well known for his Ingenuity, as Learning, will joyn and acquiesce in that sentiment.

*Of a Correspondency, to be procured, for the Finding out the True distance of the Sun and Moon from the Earth, by the Parallax, observed under (or neer) the same Meridian.*

Seeing that the knowledge of this distance may prove of important Use, for the Perfecting of Astronomy, and for the better establishing the doctrine of *Refractions*; it is in the thoughts of some very curious Persons in *England*, for the finding out the same, to settle a Correspondency with some others abroad, that are understanding in Astronomical matters, and live in places farr distant in *Latitude*, and under (or near) the same *Meridian*.

To perform which, the following Method is propos'd to be observed; *viz.* That at certain times agreed on by two Observatours, making use of *Telescopes*, large, good and well fitted for this purpose, by a measuring rod, placed within the Eye-glass at a convenient distance, that it may be distinctly seen, and serve for measuring small distances by minuts and seconds (which is easie enough in large *Telescopes*) that, I say, each of such observers, thus furnish'd, shall observe the visible way of the *Moon* among the *Fixt stars*, (by taking her exact distance from any *Fixt Starr*, that lyes in or very near her way, together with the exact time of her so appearing) and the then apparent Diameter of her Disk; continuing these Observations every time for two or three hours, that so,  
if
